                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HMW-KININOGEN LAYS AN INHIBITORS OF THIOL PROTEASES; (2)
HMW-KININOGEN PLAYS AN IMPORTANT ROLE IN BLOOD COAGULATION BY
HELPING TO POSITION OPTIMALLY PREKALLIKREIN AND FACTOR XI NEXT
TO FACTOR XII; (3) HMW-KININOGEN INHIBITS THE THROMBIN- AND
PLASMIN-INDUCED AGGREGATION OF THROMBOCYTES; (4) THE ACTIVE
PEPTIDE BRADYKININ THAT IS RELEASED FROM HMW-KININOGEN SHOWS
A VARIETY OF PHYSIOLOGICAL EFFECTS: (4A) INFLUENCE IN SMOOTH
MUSCLE CONTRACTION, (4B) INDUCTION OF HYPOTENSION, (4C)
NATRINGESIS AND DIURESIS, (4D) DECREASE IN BLOOD GLUCOSE LEVEL,
(4E) IT IS A MEDIATOR OF INFLAMMATION AND CAUSES (4E1) INCREASE
IN VASCULAR PERMEABILITY, (4E2) STIMULATION OF NOCICEPTORS (4E3)
RELEASE OF OTHER MEDIATORS OF INFLAMMATION (E.G. PROSTAGLANDINS),
(4F) IT HAS A CARDIDOROTECTIVE EFFECT (DIRECTLY VIA BRADYKININ
ACCTION, INDIRECTLY VIA ENDOTHELIUM-DERIVED RELAXING FACTOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Han Y.N., Komiya M., Iwanaga S., Suzuki T.; "Studies on the primary structure of bovine high-molecular-weight kininogen. Amino acid sequence of a fragment ('histidine-rich peptide') released by plasma kallikrein.";

"Characterization of PepB, a group B streptococcal oligopeptidase.";
Infect. Immun. 64:3401-3406(1996).

-i. FUNCTION: HAS OLIGOPEPTIDASE ACTIVITY AND DEGRADES A VARIETY OF SWALL BIOACTIVE PEPTIDES, INCLUDING BRADYKININ, NEUROTENSIN, AND PEPTIDE FRAGMENTS OF SUBSTANCE P AND ADRENOCORTICOTROPIN. ALSO PEPTIDE FRAGMENTS OF SUBSTANCE P. AND ADRENOCORTICOTROPIN. ALSO HYDROLYZES THE SYNTHETIC COLLAGEN-LIKE SUBSTRATE N-(3-[2-PROYLL]ACRYLOYL)-LEU-GLY-PRO-ALA (FALGPA).

-i. SUBCELLULAR LOCATION: CYTOPLASMIC.
-i. SUBCELLULAR LOCATION: OF PEPTIDASE FAMILY M3 (ZINC METALLOPROTEASE ALSO KNOWN AS THE THIMET OLIGOPEPTIDASE SUBFAMILY.
                                                                                                                                 Pterygota; Neoptera; Endopte: Chironomoidea; Chironomidae;

      Metalloprotease; Hydrolase; Zinc

J. Biol. Chem. 265:3738-3743(1990).
-!- FUNCTION: THIS PROTEASE IS SPECIFIC FOR IMMUNOGLOBULIN A.
-!- CATALYTIC ACTIVITY: CLEAVAGE OF IMMUNOGLOBULIN A. MOLECULES AT CERTAIN PRO-|-XAB BONDS IN THE HINGE REGION. NO SMALL MOLECULE SUBSTRATES ARE KNOWN.
-!- SUBCELLULAR LOCATION: SECRETED.
-!- DOMAIN: THE SIGNAL PEPTIDE GUIDE THE PRECURSOR TO THE PERIPLASMIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Page 27-28; 52pp; English.

The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kD glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HKa) by plasma kallikrein. It ka or a synthetic compound comprising part or all of the present sequence may be used in a pharmaceutical composition for inhibiting anylogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit and cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PΕ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PDXXXXXXX
                                                                                                                          The present sequence is derived from human high molecular weight kininogen (HK) domain 5. HK is a 120 kb glycoprotein which binds with high affinity to endothelial cells, where it is cleaved to two-chain high molecular weight kininogen (HK) by plasma kallikrein. Hka or a synthetic compound comprising the present sequence may be used in a pharmaceutical composition for inhibiting angiogenesis. Angiogenesis occurs in a number of disease states, such as tumour formation and expansion, and certain ocular disorders. It can also occur in a rheumatoid joint, hastening joint destruction by allowing an influx of leukocytes. The composition may inhibit angiogenesis by inhibiting endothelial cell proliferation or by inducing endothelial cell apoptosis. Peptides used in the composition may be recombinant peptides, natural peptides, or synthetic peptides. They may also be chemically synthesised, using, for example, solid phase synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
Light chain of human high molecular weight kininogen analogue

                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight with a compound containing high molecular weight the interest of the invention.
                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                           kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also used for inhibiting angiogenesis. The compounds can also be used inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 6; Page 37; 41pp; English

Partial peptides of bovine and kininogen fragments 1.2, 1 and 2, are used in wound treating compsns. and act as the active component. The fragments are in yound treating because they have growth promotion activity

            The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for the containing high molecular weight kininogen analogues. The method and the compounds can be used for the containing high molecular weight kininogen analogues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; high molecular weight kininogen; glycoprotein; endothelial cell; plasma kallikrein; heavy chain; light chain; analogue; angiogenesis; endothelial cell proliferation; endothelial cell migration; vitronectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also used for inhibiting angiogenesis. The compounds can also be used inhibit migration of endothelial cells to vitronectin.

                                                                                                                                                                                                                            AAR75181 is a partial peptide corresponding to human kininogen fragment 1.2, amino acids 390-520. Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compons. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

                                                                                      The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kba glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting anglogenesis. The compounds can also be used to inhibit method and such that the compounds can also be used to inhibit method and such that is the compounds can also be used to inhibit method.
